

An aerial photograph of a dense, lush green forest. The trees are tightly packed, creating a textured canopy of various shades of green. A semi-transparent, light blue-grey rectangular box is positioned in the center-left of the image, containing white text. The right side of this box is cut off by a diagonal line, creating a triangular shape that points towards the bottom right corner of the image.

Climate-friendly trade fair participation at InnoTrans 2024

Berlin, 24.-27. September 2024

InnoTrans – The future of mobility

24 – 27 September 2024 for the fourteenth time in Berlin Around 2,771 exhibitors from 56 countries and >135,000 visitors

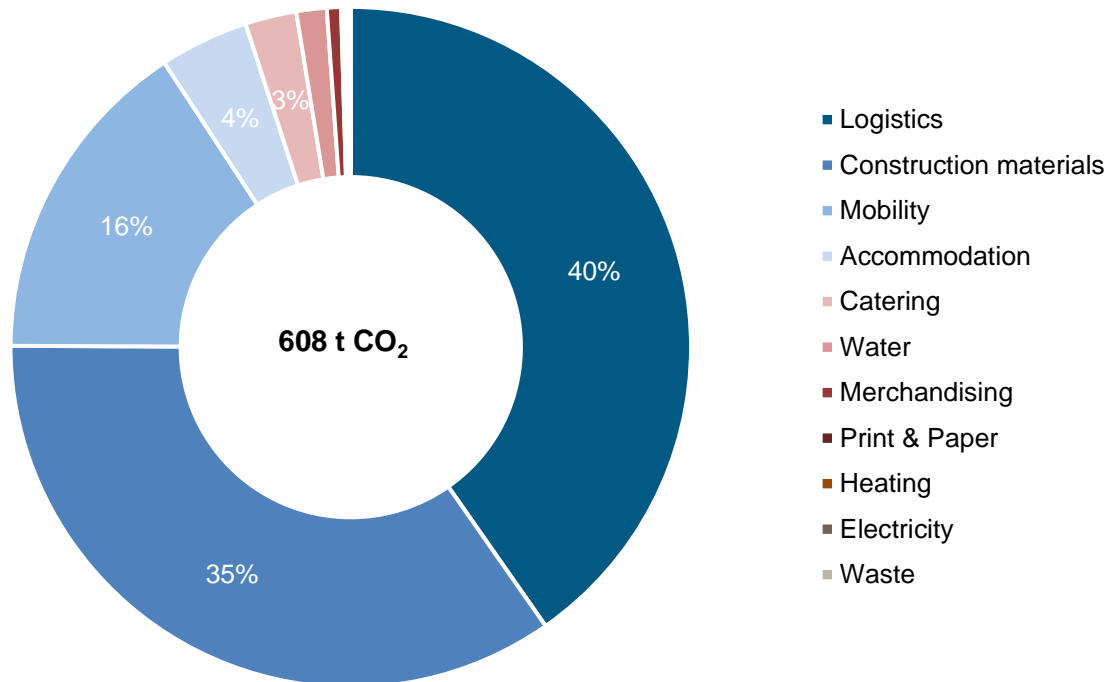

Future-orientated mobility, responsible handling of emissions: Swissrail's emissions at the trade fair are around 4.2 kg CO₂ per visitor

Measure and reduce - Swissrail takes responsibility

- 39 % Travelling by public transport
- 50 % share of vegetarian me

Event emissions 2024

The biggest emission on the carbon footprint:

Logistics (40 %)

- Transport of materials used by event vehicles

Building materials for stand construction (35 %)

- The materials for the stand, such as wood, aluminium, steel and graphics, are largely reused.
- Aluminium alone accounts for 26% of emissions in this
- Category

Arrival and departure of participants (35 %)

- 45% by own members
- 55 % of the visitors assigned to Swissrail

← significant reduction compared to 2022 😊

Climate protection and sustainable management in Swiss forests

Detailed description

In the course of their lives, trees absorb CO₂ from the air and store it in their biomass. The local forest therefore makes an important contribution to Swiss climate protection. Sustainable management is essential if it is to retain its diverse functions as a wood supplier, protective forest and recreational area.

Without the project contributions, the management of the forest of the Oberallmeindkorporation Schwyz in deficit. The timber stock would stagnate and sustainable growth would not be possible.

As a result of this project, the wood stock will be increased from 281 m³/ha to 300 m³/ha in addition to the existing stock. As a result, more CO₂ will also be stored.

The project also enables the corporation to sustainably extract energy wood from the forest without reducing the wood supply in the long term. The wood is processed locally and used to produce renewable energy in the region.

Thanks to the project contributions, both native biodiversity in the forest and the protective function against natural hazards can be supported.

Projektstandard: [SC-FCS](#)

The project secures the storage of CO₂ and the sustainable management of 7,279 hectares of forest in the canton of Schwyz. This protects the climate, preserves biodiversity in the Swiss forest and enables the production of energy wood for renewable energy production. Thanks to the project contributions, the native biodiversity in the forest can be preserved and its protective function against natural hazards can be guaranteed.

Wind energy in Karnataka, India

Karnataka, Indien

Project description

A wind power project with a capacity of 60 MW has been established in the villages around Gurmitkal Mandal in the Yadgir district, Karnataka. The project's objective is to generate electric power from wind energy by operating wind power plants.

The project activity replaces an equivalent amount of electricity that would otherwise have been consumed by a fossil fuel-fired power grid, resulting in a reduction in associated CO₂ emissions.

The project consists of 30 wind generators, each with a capacity of 2 MW. The electricity generated by the project is fed into the Indian power grid.

Numerous jobs have already been created and achieved social progress. This not only improves the livelihoods of the local population, but also ensures that the project is well anchored.

The project activity results in an emission reduction of 898,870 t CO₂ for the crediting period of 7 years.

Gold Standard
Climate Security & Sustainable Development

The wind project promotes the generation of renewable energy through wind power plants in Karnataka, India. The project activity generates clean electricity by harnessing wind power. Sustainable development in the region is supported by a variety of measures and programmes.
